Sample: CARCASS- Species: Canine

ID: CAN35/25/1 - Test: Post Mortem

| System                | Result                                                                                                                                                 |
|-----------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------|
| Findings              | Good body condition, deep avulsion contaminated wounds on the upper front limbs, congested liver, and kidneys, swollen soft tissues around the wounds. |
| Provisional Diagnosis | Septicemia due to infection.                                                                                                                           |

ID: - - Test: Post Mortem

| System                        | Result |
|-------------------------------|--------|
| Samples for further Diagnosis | -      |

Legend

| Test        | Method                  | Test procedure | Testing laboratory |
|-------------|-------------------------|----------------|--------------------|
| Post Mortem | Macroscopic examination | -              | NVL Eldoret        |

Advice:

Diagnosis:  
-Wound contamination which led to septicemia.

Advice:  
-The wounds were so severe and managing them could be very challenging to their nature and location.
